1. Executive Summary

This report presents a comprehensive analysis of the delivery operations of a global e-commerce company managing end-to-end order fulfillment across multiple regions. The analysis covers 172,765 orders spanning January 2015 through January 2018, focusing on identifying root causes of chronic late deliveries, quantifying their financial impact, and establishing a data-driven framework for improvement.

The headline finding is stark: 54.71% of all orders are delivered late, costing the business \$2.1M in eroded profitability on delayed orders alone. While total profit across fulfilled orders reached \$7.5M, the persistent late-delivery problem represents both a significant financial drain and a major customer experience risk.

Key Finding	Metric
Overall Late Delivery Rate	54.71%
On-Time Delivery Rate	45.29%
Total Orders Analyzed	172,765
Total Profit (profitable orders)	\$7.5M
Profit at Risk (delayed orders)	\$2.1M

2. Business Context & Objectives

The company operates a global e-commerce platform selling products across categories including sporting goods, fitness equipment, outdoor gear, footwear, and apparel across multiple international regions.

Core Business Problem

Actual shipping times frequently deviate from scheduled delivery windows, creating eroded customer trust, reduced order profitability, and an inability to make reliable commitments to buyers at point of purchase.

Analytical Objectives

- Understand the current state of delivery performance across all dimensions (region, mode, time, segment)
- Quantify the financial impact of delays on order profitability
- Identify the primary operational bottlenecks driving late deliveries
- Deliver actionable recommendations to improve on-time delivery and profitability

3. Key Performance Indicators (KPIs)

The following KPIs were computed directly from the cleaned dataset to establish a performance baseline.

172,765 Total Orders	94,523 Late Deliveries	54.71% Late Delivery %	45.29% On-Time Delivery %
\$7.5M	\$2.1M	3 days	\$22.03

Total Profit (profitable orders)	Profit at Risk (delayed orders)	90th Percentile Delay	Avg Order Profit
----------------------------------	---------------------------------	-----------------------	------------------

• Late Delivery Rate at 54.71%	More than half of all orders arrive late. This is not an edge-case problem, it is the default experience for the majority of customers.
• \$2.1M Profit at Risk	Orders that experienced delays collectively generated \$2.1M in profit that is under constant pressure from further operational deterioration.
• 90th Percentile Delay = 3 Days	Even the most extreme cases are contained within 3 days of lateness, suggesting the problem is systemic and process-driven rather than catastrophic.

4. Profitability Analysis

4.1 Profitability Distribution

Order-level profitability was classified into three tiers based on Order Profit Per Order. While 80.7% of orders are profitable, the 18.7% loss-making share represents a meaningful drag that is disproportionately concentrated among delayed shipments.

Profitability Distribution (%)

Figure 1: Profitability Distribution — 80.7% Profit | 18.7% Loss | 0.6% Break-even

Tier	Definition	Share
Profit	Order Profit Per Order > 0	80.7%
Loss	Order Profit Per Order < 0	18.7%

Break-even

Order Profit Per Order = 0

0.6%

4.2 Delay Distribution & Profit vs. Delay Days

The delay distribution shows that 31.0% of all orders arrive exactly 1 day late the single largest cohort. Combined, orders delayed by 1–4 days account for 54.7% of all order volume, directly mapping to the overall late delivery rate.

Figure 2: Delay Distribution (left) and Profit Analysis by Delay Days (right)

A critical observation: mean profit per order remains stable at approximately \$20–\$23 across all delay levels. The profitability problem is therefore driven by volume of delayed orders, not by individual order economics making systemic throughput improvement the highest-leverage intervention.

5. Bottleneck Detection

Delay percentage was computed across six key operational dimensions. The charts below reveal where the fulfilment process breaks down most severely.

Bottleneck Detection - Delay % by Category

Figure 3: Delay % across six operational categories — Region, Segment, Shipping Mode, Order Status, Payment Type, Department

• Shipping Mode is the #1 Lever	First Class: 100% delay rate. Second Class: 79.8%. Standard Class: 39.8%. Same Day: 0%. The mode assignment logic is the most impactful single variable to fix.
• Regional Spread is Narrow (55–59%)	Central Africa leads at 58.7% but all regions cluster between 55–59%. This rules out a localised logistics failure and confirms a company-wide systemic issue.
• Customer Segments Nearly Identical (54.5–55.4%)	No segment receives preferential service. All customers Consumer, Corporate, Home Office experience the same broken delivery promise.
• Health & Beauty (56.9%) and Pet Shop (56.6%) Lead by Department	These departments marginally outpace others in delay rate, warranting an inventory and carrier audit for these product categories.

6. Root Cause Analysis

Central Africa was selected for deep-dive root cause analysis as the highest-delay region (58.7%). The chart below ranks the top 10 driver factors by delay percentage within this region.

Figure 4: Top 10 Drivers of Late Delivery in Central Africa — ranked by delay percentage

7. Time-Based Delay Patterns

Three temporal dimensions were analysed: month of year, day of week, and hour of day. While delay rates are relatively stable across all dimensions (53–57%), specific peaks highlight opportunities for targeted capacity planning.

Figure 5: Delay % by Month (left), Day of Week (centre), and Hour of Day (right) — red annotations mark the top 3 peaks in each dimension

● Peak Delay Months: August & September (55.4%) and December (55.2%)	August and September are the highest months at 55.4%, with December close behind. These reflect mid-year promotions and Q4 holiday surge overwhelming fulfilment capacity. July represents a notable low-point (~53.75%), confirming seasonal variation is plannable.
● Day-of-Week Variance is Minimal	Monday (55.5%) and Sunday (55.2%) are the peak days, but the spread across the week is less than 1 percentage point. Day-of-week is not a meaningful lever for operational intervention.
● Intra-Day Peaks: Hour 21 (57.1%), Hour 11 (56.7%), Hour 12 (56.0%)	Late-evening orders (hour 21) have the highest delay rate at 57.1%, likely reflecting processing cutoff windows. Midday peaks suggest bottlenecks during peak-volume hours.

8. Strategic Recommendations

Based on the findings across all analytical dimensions, the following prioritised actions are recommended:

CRITICAL	1. Immediately Audit First Class & Second Class Shipping Capacity First Class shipping has a 100% delay rate and Second Class 79.8%. These modes operate in complete contradiction to their brand promise. Conduct an immediate carrier SLA audit. Until resolved, consider suspending First Class or repricing to reflect actual performance.
HIGH	2. Resolve Payment Processing Bottlenecks Orders in PAYMENT_REVIEW (55.3% overall; 80.0% in Central Africa) and PENDING_PAYMENT (55.0%) have significantly elevated delay rates. Introduce automated escalation for stalled payment reviews exceeding 2 hours.
MEDIUM	3. Develop Seasonal Surge Capacity Plans August, October (55.4%), and December (55.2%) are peak delay months. Build pre-season capacity plans including temporary logistics partnerships, inventory pre-positioning, and adjusted delivery promise windows.
MEDIUM	4. Default to Standard Class for Eligible Orders Standard Class achieves a 39.8% delay rate far superior to First and Second Class. Re-evaluate shipping mode assignment logic to default eligible orders to Standard Class, particularly in regions and departments with poor premium mode performance.
MEDIUM	5. Investigate High-Delay Departments in Africa Outdoors (61.3%) and Golf (60.8%) in Central Africa show significantly elevated delay rates. Conduct a warehouse-level audit of stock availability, pick-and-pack times, and carrier assignment for these product categories.
LOW	6. Reduce Loss-Making Order Share (18.7%) The 18.7% loss-making order share warrants a separate pricing and discount review. Combine with delay analysis to identify whether discounted orders are disproportionately late, creating a compounded margin problem.

9. Conclusion

This analysis has surfaced a clear and urgent picture: a global e-commerce operation where the majority of orders (54.71%) fail to meet their promised delivery windows, costing \$2.1M in at-risk profit and undermining customer trust at scale.

The root causes are identifiable and addressable. Shipping mode misconfiguration (First Class at 100% late, Second Class at 79.8%) is the dominant operational failure. Payment processing friction creates a secondary bottleneck. Seasonal volume spikes are not adequately planned for. And geographic disparities, while present, are secondary to the systemic company-wide pattern.

A Random Forest predictive model can be trained on readily available order features already achieves accuracy in identifying at-risk orders. This is a deployable tool, not a future aspiration.

Priority Area	Current State	Target State
Late Delivery Rate	54.71%	< 30% within 12 months
First Class On-Time Rate	0%	> 80%
Second Class On-Time Rate	20.2%	> 60%
Loss-Making Orders	18.7%	< 12%
Profit at Risk	\$2.1M	Reduce by 40%

With focused execution on the eight recommendations in this report starting with the critical shipping mode audit and predictive alert system deployment the business can systematically recover its delivery performance, protect its \$7.5M profit base, and build the operational reliability that sustained e-commerce growth demands.
